DATA TECHNOLOGY

Pick by Voice

Voice-operating commissioning

Hands free, eyes free

Communicate via Pick-by-Voice by hearing and speaking with your warehouse management system and have your hands and eyes free to lift and transport goods also while wearing working gloves. This will increase your picks per hour, enabling you to have a higher productivity and also an increased reliability in avoiding errors in order processing.

Effective, simple and safe

The voice recognition and voice output to the head set are controlled by the hand-held terminal M250, which is directly connected with the warehouse management system via WLAN. This solution provides a very high reliability in voice recognition independent from the speaker and it is constructed according to a simple modular system. Specifically adjusted, extensive actions in warehouse logistics can be displayed effectively. A further advantage is that the same M250 hand held terminal can be used for non-pick by voice applications in the warehouse.

Fast and flexible

Synchronize your material and data flow by online communication between mobile computers and the network of your ERP or warehouse management system. ACD hand-held terminals communicate with up to 54Mbit/s in modern WLAN networks according to IEEE 802.11a/b/g/h or via GSM/GPRS/UMTS mobile network. This enables you to perform real time stock management, as well as flexibility and a permanent monitoring.
